Homework 15.

Problem 1. 20 points. 1D emittance

For an ensemble or a distribution function of particles 1D geometrical emittance is defined as

$$\varepsilon_{y}^{2} = \langle y^{2} \rangle \langle y'^{2} \rangle - \langle yy' \rangle^{2};$$

$$\langle g(y,y') \rangle = \frac{\sum_{n=1}^{N_{p}} g(y_{n},y'_{n})}{N_{p}} = \int f(y,y')g(y,y')dydy';$$

1. Show that the emittance is invariant to a Canonical linear (symplectic matrix) transformation of

$$\begin{bmatrix} y \\ y' \end{bmatrix} = M \begin{bmatrix} y_1 \\ y'_1 \end{bmatrix}$$

Note: use the fact that $\varepsilon_{y^2} = \det \Sigma; \Sigma = \begin{bmatrix} \langle y^2 \rangle & \langle yy' \rangle \\ \langle yy' \rangle & \langle y'^2 \rangle \end{bmatrix}$; and find transformation rule for

the Σ matrix.

2. For one-dimensional betatron (y) distribution find components of eigen vector w_y and w'_y generating a given (positively defined)

$$\Sigma = \begin{bmatrix} \langle y^2 \rangle & \langle yy' \rangle \\ \langle yy' \rangle & \langle y'^2 \rangle \end{bmatrix};$$

This operation is called matching the beam into the beam-line optics.
