

1. The maximal gain happens at the detuning satisfying the following equation.

$$\frac{d}{d\hat{C}} \left[\hat{C}^{-3} \left(1 - \cos \hat{C} - \frac{1}{2} \hat{C} \sin \hat{C} \right) \right] = \hat{C}^{-4} \left[3 \cos \hat{C} + 2 \hat{C} \sin \hat{C} - \frac{1}{2} \hat{C}^2 \cos \hat{C} - 3 \right] = 0. \quad (1)$$

Numerically finding the solutions of

$$3 \cos \hat{C} + 2 \hat{C} \sin \hat{C} - \frac{1}{2} \hat{C}^2 \cos \hat{C} - 3 = 0 \quad (2)$$

, which leads to maximal gain, gives

$$\hat{C} \approx 2.606. \quad (3)$$

Inserting the definition of \hat{C} into eq. (3) leads to

$$Cl_w = \left(k_w + k - \frac{\omega}{v_z (\varepsilon_0 + \Delta\varepsilon)} \right) l_w \approx \frac{\omega l_w}{\gamma_z^2 c} \frac{\Delta\varepsilon}{\varepsilon_0} = 2.606 \quad (4)$$

, or

$$\frac{\Delta\varepsilon}{\varepsilon_0} = 2.606 \frac{\gamma_z^2 \lambda_0}{2\pi l_w} = 2.606 \frac{\lambda_w}{4\pi l_w} = \frac{2.606}{4\pi} \frac{1}{N_w}, \quad (5)$$

where $N_w = l_w / \lambda_w$ is the number of wiggler period.
